

CSS Flexbox Breakdown

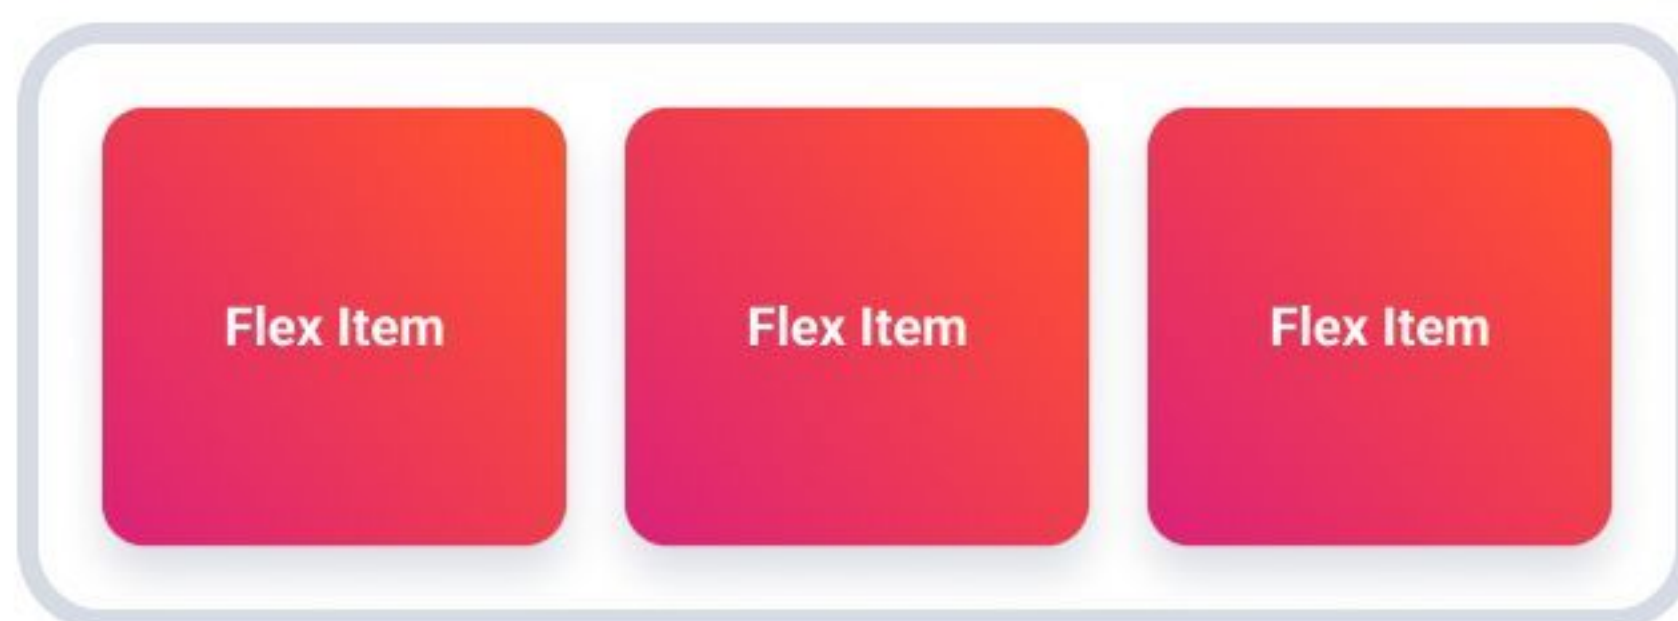

What is Flexbox?

Flexbox is a one-dimensional layout model that offers space distribution between items. To start using the Flexbox model, you need to first define a flex container.

```
display: flex;
```

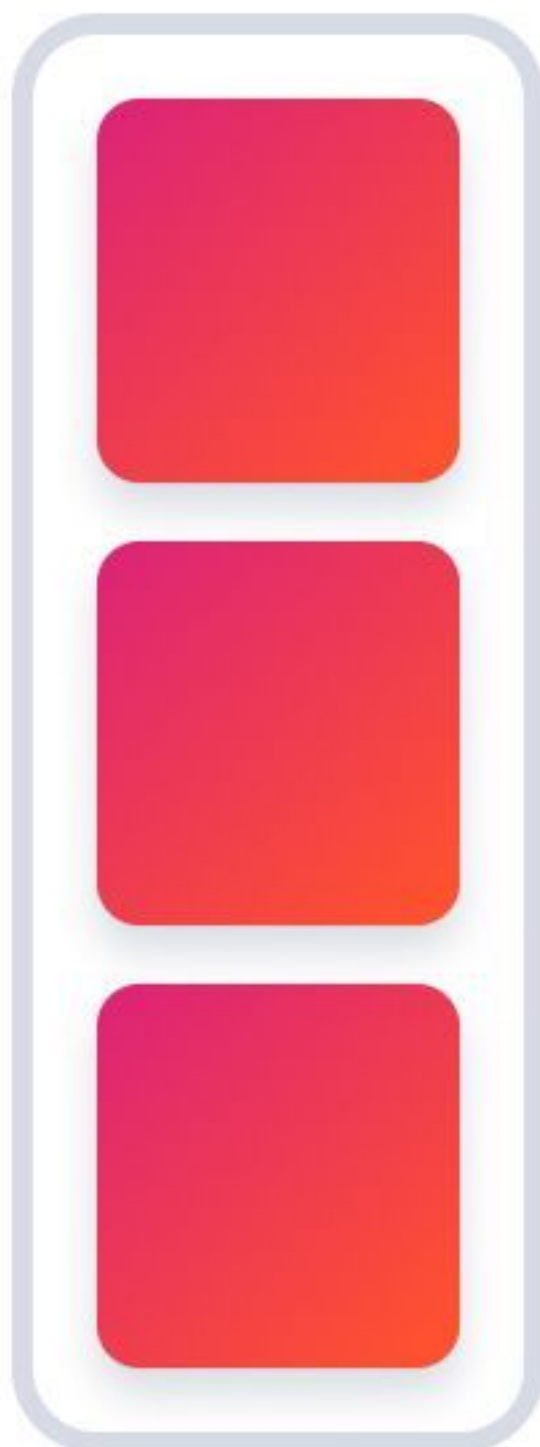

Flex Container

Flex Direction

This property defines whether the flex items are laid out in a row or a column.

```
flex-direction: column
```

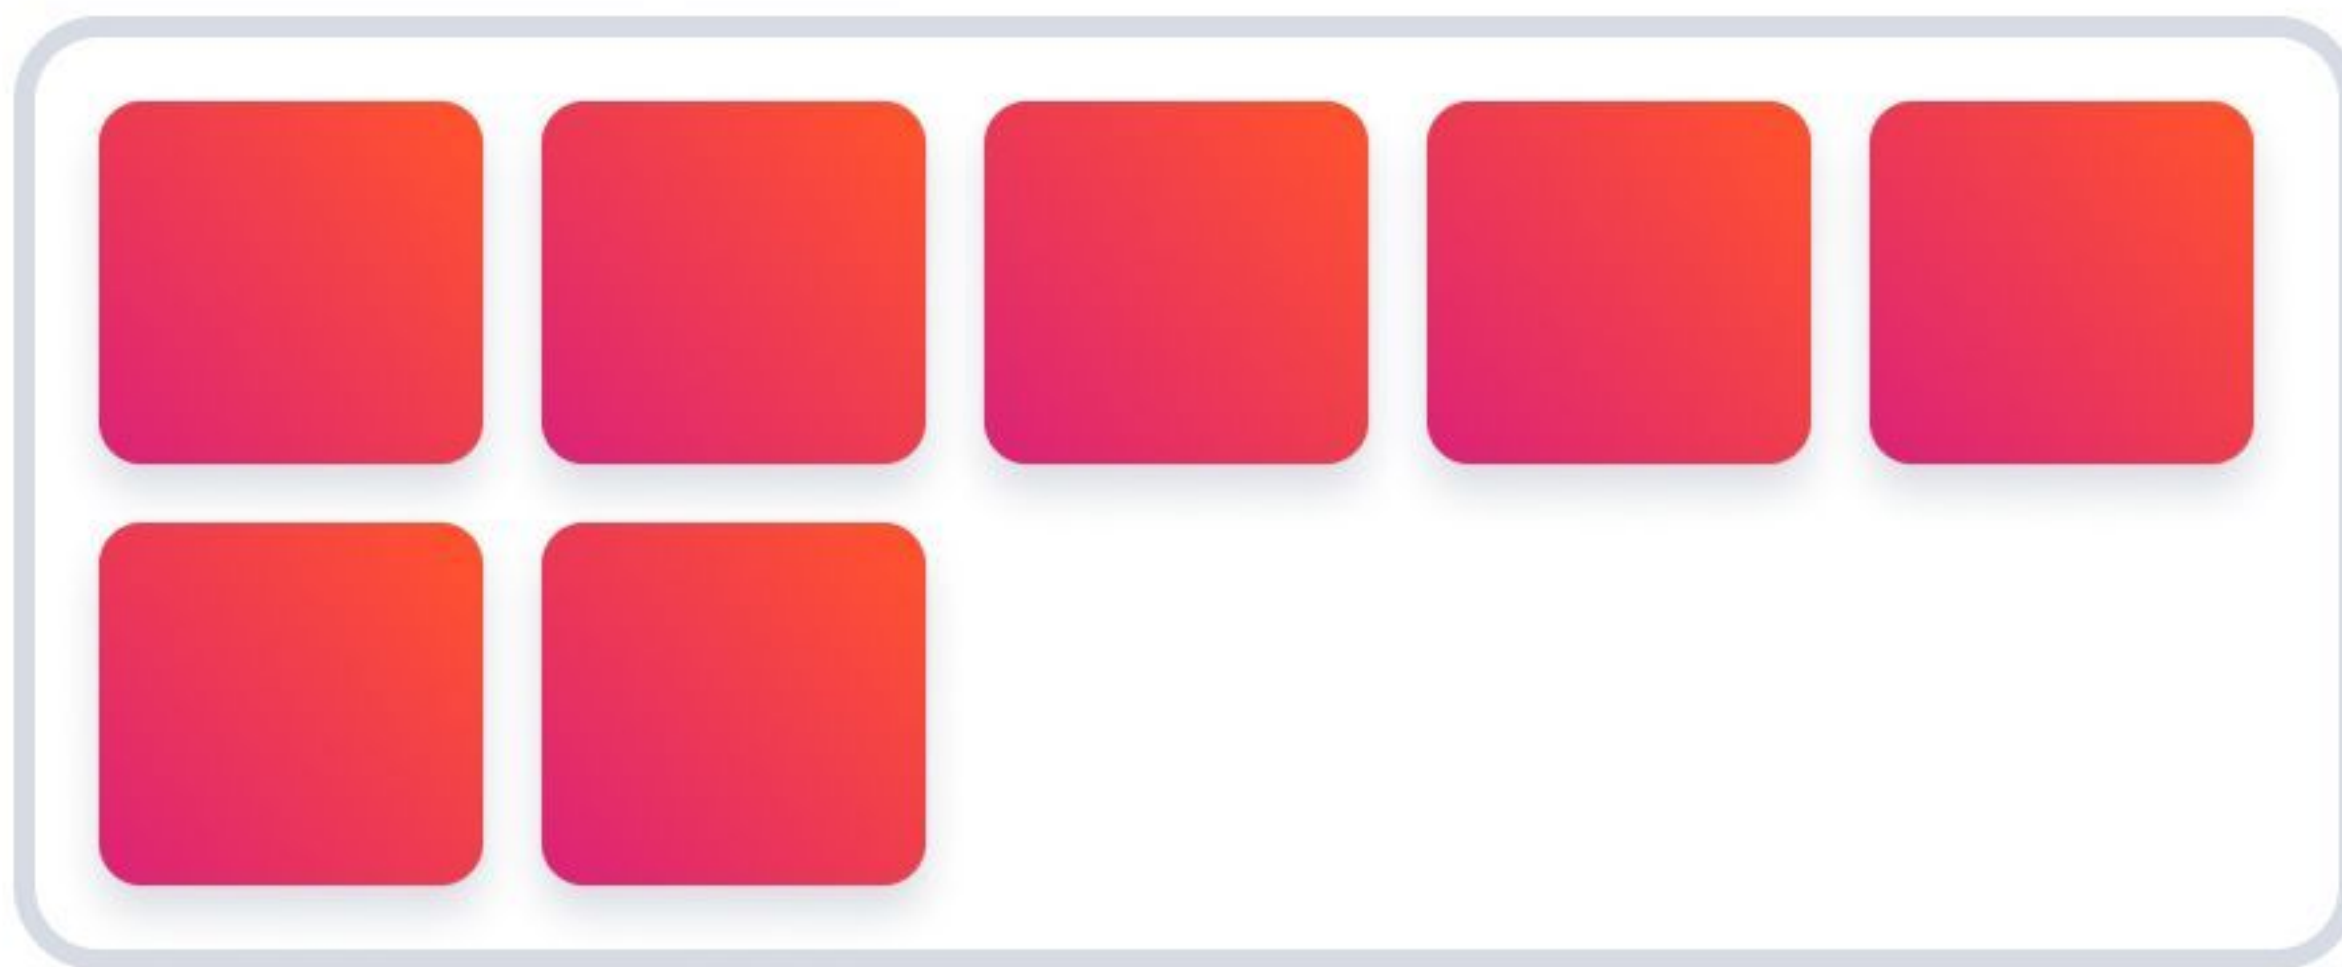

```
flex-direction: row
```

Flex Wrap

This property specifies whether flex items are forced into a single line.

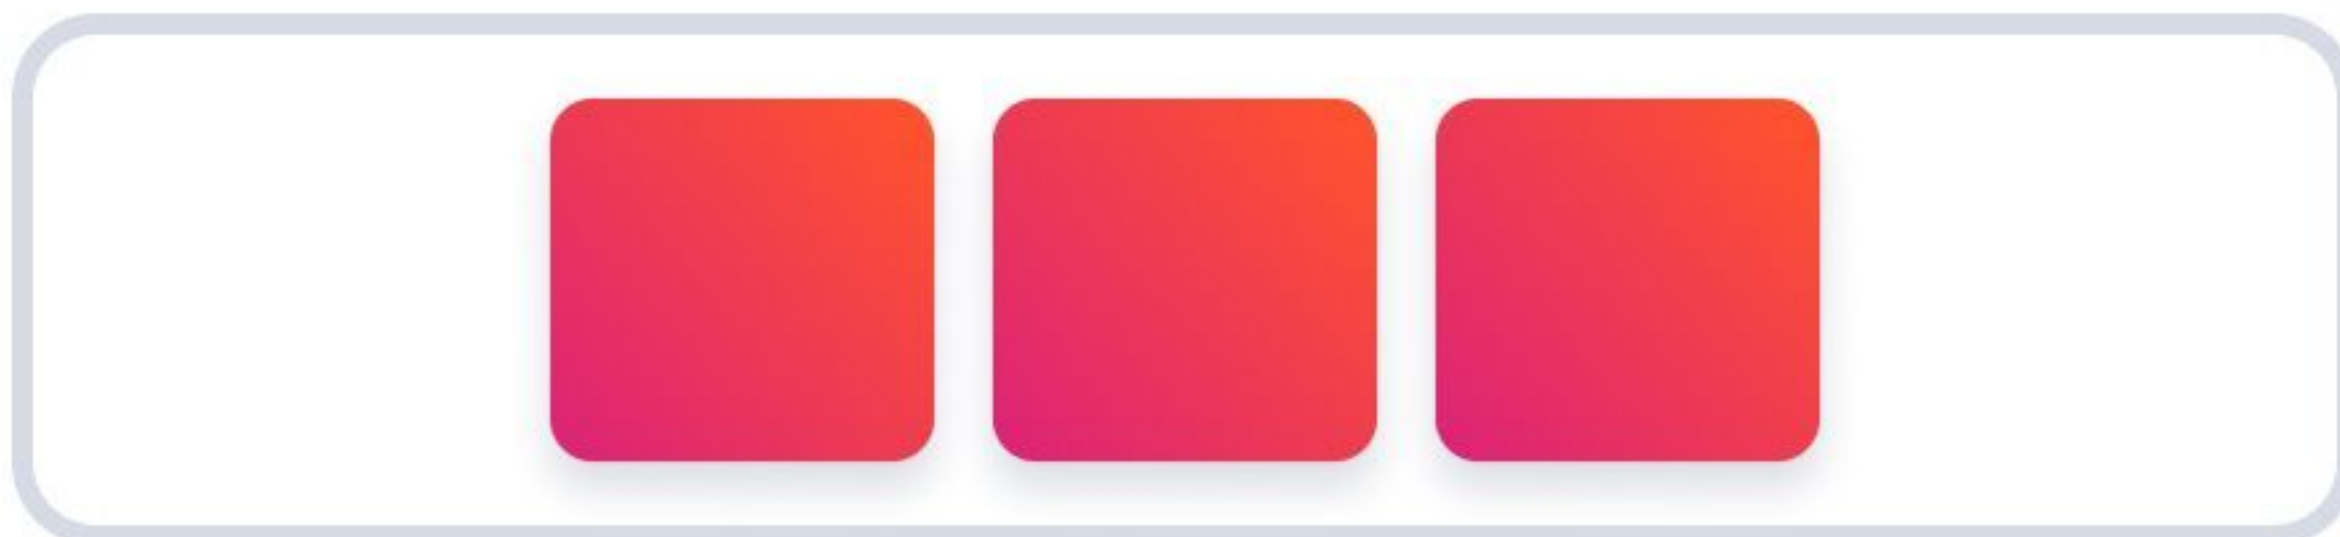

```
flex-direction: wrap
```

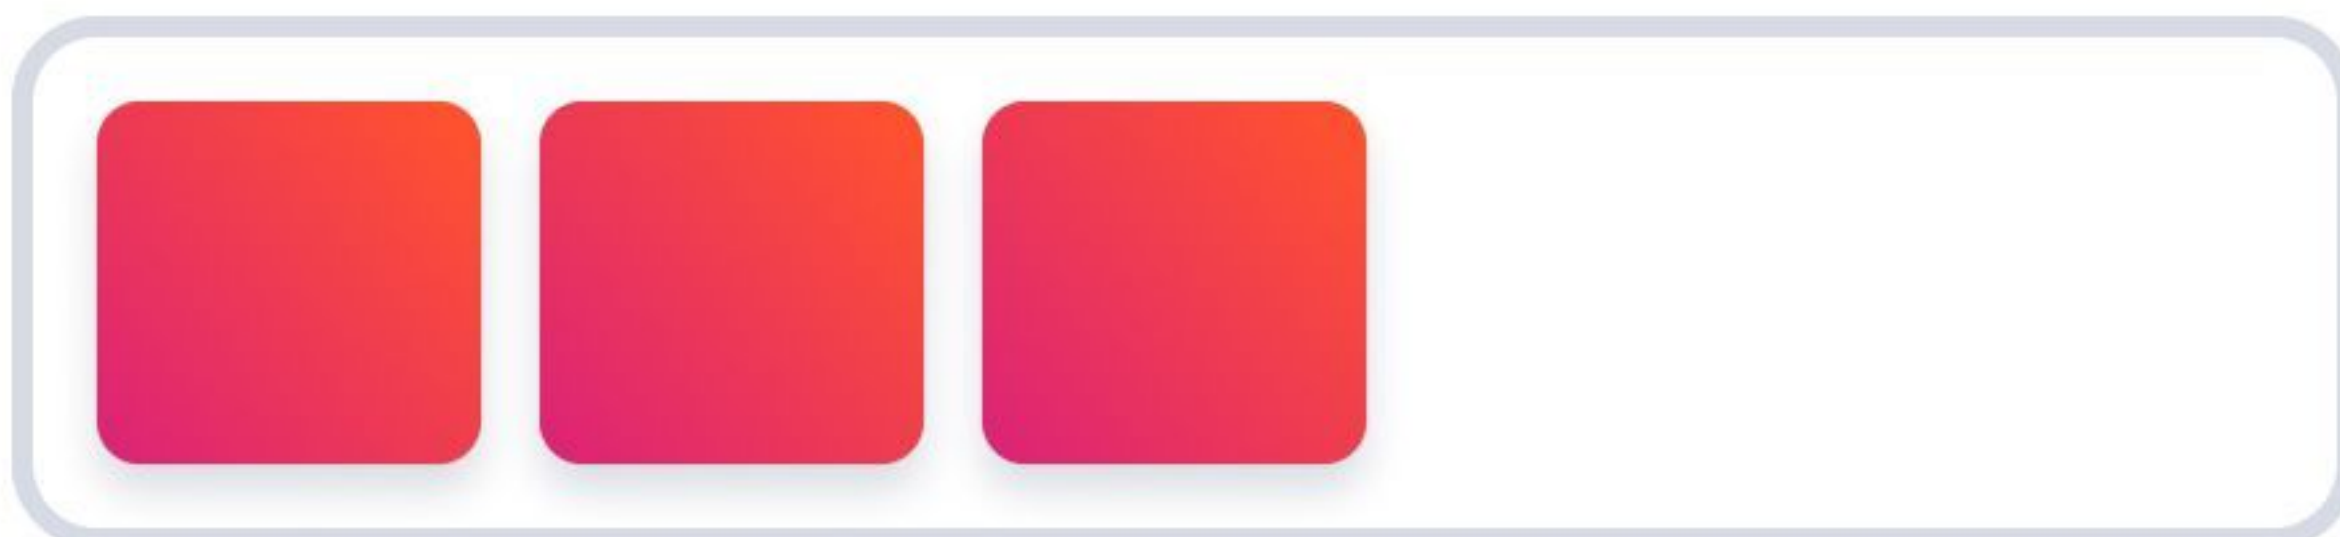

Justify Content

This property defines how the browser distributes space between and around flex items along the main-axis of their container.

```
justify-content: center
```

```
justify-content: flex-start
```

Align Items

This property defines the default behavior for how flex items are laid out along the cross axis.

```
align-items: center
```

Order

This property controls the order in which flex items appear within the flex container.

```
.div-one {  
  order: 1;  
}
```

```
.div-two {  
  order : 3;  
}
```
